## Problem to Mathematics Magazine

Does exist no constans function  $f : \mathbb{R} \rightarrow \mathbb{R}$  , that  
 $f(x) + f(2x) = (x + 1)f(f(x))$  for all real  $x$  ?

Solution :

Yes . Example :

$$f(x) = \begin{cases} -3 & \text{for } x = 2^k, \text{ where } k = 2m, m - \text{integer} \\ 3 & \text{for } x = 2^k, \text{ where } k = 2m + 1, m - \text{integer} \\ 0 & \text{for other } x \end{cases}$$

Best wishes
